

cubus outperform EV Analytics

TOP 15 Voting Results 2018

No	Name	Description
1	Support for IF-THEN-ELSE in calculator	Calculated members should support IF-THEN-ELSE. Provide more functions and logic in the calculator. Similar to Excel functions.
2	Ability to cancel long running processes	Add the option for users to cancel long running queries.
3	Global formatting	The ability to create styles and formats on a global level. This includes fonts, colors and number formatting. It should also be possible to define your own color palette.
4	Conditional formatting	Add the option to define a format based on a condition. For example, the value of a cell or the value of a calculation.
5	Global calculations	The ability to create calculator functions for a database on a global level. These calculations can then be used in every view connected to that particular database.
6	Add logo to customize printing/PDF start page	Allow the user to add a logo to the pages when printing views.
7	Dynamic selections	Improve the dynamic selections of members, for example, all level 0. If the database changes, this is automatically reflected when opening view, you do not have to explicitly select the member again or use a dynaselect to ensure that all level 0 members are selected. It should also be possible to retrieve the top 20% of members.
8	Logout function in EV	Add a logout button in the backstage area to allow sessions to be terminated.
9	PowerPoint reporting	Add possibilities to export data directly to a powerpoint field, for example a specific cell, an entire table or a chart. This will enhance the reporting capabilities of EV.
10	Allow analysis of relational data	At the moment it is only possible to analyse OLAP data in EV. Add the possibility to analyse relational data in EV.
11	Ability to modify a dynaselect	Once saved there is no way to modify a dynaselect. It would be nice to come back to previous step of the recording without re-recording everything.
12	Conditional suppression	At the moment, rows and columns can be suppressed for missing, zero or no access. The idea is to enhance this functionality for conditional statements. For example, suppress the row if the value in the third column is equal to 3.
13	Brushing and linking in charts	Introduce the possibility to select a subset of data in the chart with drag and drop. The table will then automatically be updated with the new selection.
14	Add image/logo to report title	It is possible to display a title in a report with different formatting options. This functionality can be enhanced to display an image.
15	Dependable member selections	It should be possible to filter a member select list based on the selection of another dimension. For example, show only the products relevant to the region East.

This list was created by a voting process initiated by cubus in October 2018. The proposed list of features was based on feedback from customers, partners and employees we received in the last months. EV users from different customers and partners and from different countries working on different OLAP-engines (TM1, MSAS, Essbase) had been invited to vote for new features for cubus outperform EV.

We will consider this ranking in our development plans for the next cubus EV versions. We may not implement all these features in the next releases. We will decide based on technical feasibility and implementation effort which features will be in the next releases.
